

The [Openmoko FreeRunner](#) mobile device is a FOSS powered mobile phone suited for a wide range of applications usually thought only possible with a fully fledged computer. Being a hand-held mobile device, the FreeRunner introduces the potential for ubiquitous computing in a range of environments and scenarios where such actions would either be physically unfeasible or cost prohibitive.

Flexibility is the key to the power of the FreeRunner; we can provide a complete software stack, running in the palm of your hand, that meets your requirements.

OA Digital believes so passionately in the FreeRunner that we have become a Value Added Reseller of the device; we specialise in providing the device preconfigured to be used within either your existing infrastructure, or as part of an OA Digital provided solution.
